

Polycystic Kidney Disease

What Your Family Needs to Know

For families everywhere, the statistics can be scary. Polycystic Kidney Disease (PKD) is the most common of all life-threatening genetic diseases, affecting 12.5 million newborns, children and adults worldwide. In fact, PKD afflicts more people – more families – than Down syndrome, cystic fibrosis, muscular dystrophy, sickle cell anemia and hemophilia – combined. There is no treatment. And no cure. Until one is found, PKD will threaten the lives of every generation of every family dealing with the disease.

To learn more about PKD and to register your family for the annual Walk for PKD this September, please contact the PKD Foundation at **(800) PKD-CURE** or **www.pkdcure.org**.
