

POLYCYSTIC KIDNEY DISEASE TAKING LIVES ONE GENERATION AFTER ANOTHER

The statistics are scary. More than 600,000 Americans and 12.5 million newborns, children and adults worldwide battle polycystic kidney disease (PKD) every day. It's the world's most common life-threatening genetic disease and affects more people than cystic fibrosis, muscular dystrophy, hemophilia, Down syndrome and sickle cell anemia — combined. Parents with PKD have a 50 percent chance of passing the disease on to their children. There is no treatment. And no cure. Until one is found, PKD will threaten the lives of every generation of every family dealing with the disease.

To learn more about PKD, call (800) PKD-CURE or visit www.pkdcure.org.
